

35kV busbar impacts several times

Overview

A 35 kV PT explosion in a thermal power plant caused busbar outages and grid risks. Explore root causes, fault progression, protection response, and how to prevent similar failures with insulation testing and resonance overvoltage mitigation. This article introduces a case of 35kV ring main unit busbar insulation breakdown failure, analyzes the failure causes and proposes solutions, providing reference for the construction and operation of new energy power stations.

1 Accident Overview

On March 17, 2023, a photovoltaic. Busbars in power systems are the location where transmission lines, generation sources, and distribution loads converge. Because of this convergence, short circuits located on or near the busbar tend to have very high magnitude currents. The high magnitude fault currents require high-speed. A busbar protection must be capable of clearing all phase-to-earth faults, and in the case where they can occur, phase-to-phase faults. Techniques for remaking bus. We have used 3M BBI Heat Shrink many times with great results indoors (or outdoors but enclosed and heated) Is there any chance that inadvertant contact (people, ladders, items on a forklift or from above, or squirrels and rats) could touch the exposed conductors and surroundings?

Many insulated.
