

FTTR connected to beam splitter

Overview

Equipped with standard input and output optical ports, it connects to edge ONTs through an optical splitter. It also includes GE, POTS interfaces, and supports WiFi standards. FTTR (Fiber to the Room) extends fiber optic cabling from the entrance to every room, providing whole-home high-speed network coverage. Compared to traditional Ethernet or Mesh WiFi, FTTR offers higher bandwidth, lower latency, and longer lifespan (25-30 years for fiber).

- Optical Splitter: FTTR (Fiber to The Room) technology, by directly extending the optical fiber to each room of the user, further upgrades the traditional fiber-to-the-home to fiber-to-the-room, and provides a new Gigabit network coverage solutions, which will be one of the technical directions for future Gigabit. Optical splitters and couplers split or combine light—distributing signals injected into a single fiber strand to multiple fibers, enabling point to multi-point communication in Fiber To The Home (FTTH) networks based on ITU. Applications such as online learning, remote work, online gaming, video conferencing, live.

Why is FTTR developing rapidly?

world and more than 90% in China. gigabit coverage in the whole house. And more than 2 million used FTTR service. More. As 200 Mbps or higher bandwidth becomes the mainstream and requirements for services such as online education, video, VR, e-Sports, and smart office increase sharply, users need Wi-Fi that supports high bandwidth, low latency, wide coverage, and multi-user concurrent access, driving operators to.
