

High Temperature Resistance of Vehicle-Mounted Fiber Optic Active Optical Devices

Overview

Specialty optical fibers can be produced with a polyimide coating, which allows these fibers to be used in environments up to 300°C. However, glass fibers need to be protected. JAE has developed a prototype in-vehicle Active Optical Cable (AOC) to address noise countermeasures in critical automotive networks related to safety within the automotive technology trend of zonal architecture. Currently, EVs have already implemented zonal architecture, which is becoming a future. Optical fiber's ability to withstand extreme heat and cold directly impacts signal integrity, network reliability, and maintenance costs, especially in harsh environments like industrial facilities, outdoor installations, and data centers. This comprehensive guide answers the question: "How much. Improved fatigue resistance, high usable strength, and excellent resistance to higher temperatures.
