

High-voltage switchboard microprocessor relay protection fault

Overview

Verify that power system has sufficient redundant and back-up protection while relay is out of service for testing. Use test switches to isolate output contacts to prevent undesired tripping and alarms. For the most effective protection, many utilities and industrial facilities are replacing aging electromechanical relays with new generation microprocessor-based relays. This. Consideration is given to availability and location of breakers, current transformers, and disconnectors as well as bus switching scenarios, and their impact on the selection and application of bus protection. New directional elements and distance polarization methods make ground fault detection more sensitive, secure, and precise than ever. Be aware of effect on other relays in system. Therefore, it is necessary to. The PR512 relays are devices using digital microprocessor-based technology to obtain data processing regarding the protection.
