

## How to coil up excess fiber optic cable

### Overview

For a non-permanent fix, coil the wire neatly and secure it with Velcro straps. Do not apply more pulling force to the cable than specified. After the communication engineers complete the optical fiber splicing in the fiber splice enclosure box, they need to coil the optical fibers one by one so that they cannot have excessive bending angles that will affect normal telecommunication. They also require the optical fibers to be beautiful. This isn't cable porn, this needs a lot of work. Your cable should be coming in on either the top left or bottom right section so that the cable can just be routed without any change of direction. You need cable ties to secure both the incoming cable and the pigtails going out. Pigtails need a. The cable is at an intermediate pole where 30m of slack is left for a future joint. The cable is a pull through with out any joints. Failure to follow these guidelines may result in damage or attenuation increases of the optical fiber or cable.
