

How to illuminate the lines on the optical module

Overview

This paper examines lighting technologies and techniques for line scan illumination. What is a line scan application?

High quality illumination is the key to a successful vision system. Fundamentally, a line scan camera differs from an area scan camera in that it has a linear array of sensors as opposed to a two-dimensional (2D). A basic understanding of illumination types and techniques, geometry, filtering, sensor characteristics, and color, as well as a thorough analysis of the inspection environment, including part presentation and object-light interactions, provide a solid foundation when designing an effective vision. The QDD Optical Line System (OLS) pluggable optical amplifier is now supported on QSFP28 ports. The QDD Optical Line System (OLS) is a new pluggable optical amplifier that interconnects two routers or switches for transmitting traffic on a limited number of coherent optical channels over a single.
