

OCS optical switch physical object

Overview

An OCS (Optical Circuit Switch) is an all-optical switching device that operates at the physical optical layer. Its core function is to establish direct optical paths between different fiber optic ports on demand, enabling direct routing and interconnection of optical signals. The optical circuit switch (OCS) is rapidly becoming the most important new building block in hyperscale and AI data center architecture. As GPU clusters scale to tens of thousands of accelerators and 800G/1. The result is a reconfigurable fabric that reduces complexity and power consumption while supporting. By establishing on-demand end-to-end optical paths at the physical layer, OCS bypasses intermediate packet processing, achieving ultra-low latency, non-blocking bandwidth, and superior energy efficiency, thereby providing a new architectural alternative for AI training clusters and high-performance. The Lumentum R300 Optical Circuit Switch (OCS) brings a new level of scalability, latency, and power efficiency to cloud-scale and AI/ML data center networks. Built on field-proven Lumentum micro-electro-mechanical systems (MEMS) technology with over a trillion mirror operating hours, the R300. With data transmission and network speeds transitioning to 100 Gb/s, 400 Gb/s and beyond, Calient offers the lowest price per port of any switching technology.
