

Optical Coupler Operations

Overview

Coupling at optical frequencies presents challenges to achieving high efficiency, compactness, high fabrication tolerance, and ease of integration in photonic integrated circuits. An optocoupler is a coupling device used to couple optical signals. It's primarily employed to combine and split signals in optical networks, and it's also referred to as a directional coupler. It involves the transfer of power between different circuit components, the split or combination of power from multiple locations, and (de)multiplexing of signals with varying frequencies. The PLC coupler is fabricated on a silica or Silicon photonics has drawn increasing attention in the past few decades and is a promising key technology for future daily applications due to its various merits including ultra-low cost, high integration density owing to the high refractive index of silicon, and compatibility with current.
