

Optical Module LPT

Overview

A: Linear Pluggable Optics refers to a solution that utilizes a low-power pluggable module that does not incorporate a DSP chip. The signal path from end to end in the link is considered linear, enabling lower power consumption through specialization. The idea is simple: instead of a DSP (digital signal processor) inside the module – replacing it with transimpedance amplifier (TIA) and a driver chip with high linearity and EQ capability – LPO shifts signal processing into the system. The relentless demand for higher bandwidth, lower latency, and improved power efficiency in hyperscale data centers and AI/ML clusters is pushing optical interconnect technology to its limits. Traditional pluggable optics with sophisticated DSPs face challenges in power consumption and cost at 800G. An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a
