

## Precautions for Fiber Channel Testing

### Overview

Fiber optic sources, including test equipment, are generally too low in power to cause any eye damage, but it's still a good idea to check connectors with a power meter before looking into it. Some telco DWDM and CATV systems have very high power and they could be harmful, so testing no longer holds true. Consultants and cabling vendors alike are now starting to specify loss budgets based on component performance, not standards. The allowable slack in testing practices has disappeared. Corning recommends that all fiber optic systems be tested to a minimum set. Source and power meter, optical loss test set or test kit with proper equipment adapters for the cable plant you are testing. Reference test cables that match the cables to be tested and mating adapters, including hybrids if needed. Sections are included for project management; cable handling, testing and equipment; overhead cable placement; underground cable placement; underground enclosures; bonding and grounding; cable. n TIA-568-C. 0, but this does not mean it is not important. The OTDR full tool is does not replace the need for. This Applications Engineering Note (AEN 135) explains and recommends standard measurement methods for characterizing optical fiber system performance.
