

Spatial Light Modulator Mode

Overview

A spatial light modulator (SLM) is a device that can control the intensity, phase, or polarization of light in a spatially varying manner. A simple example is an overhead projector transparency. Usually when the term SLM is used, it means that the transparency can be controlled by. Liquid crystals are birefringent, so applying a voltage to the cell changes the effective refractive index seen by the incident wave, and thus the phase retardation of the reflected wave. The ability to control the amplitude and phase of optical wavefronts has many important scientific and technological. Current wavefront shaping technologies face a fundamental dichotomy: spatial light modulators (SLMs) offer high pixel count but suffer from low refresh rates, while acousto-optic deflectors (AODs) provide moderate speed with restricted optical beam geometries [25, 26]. The content covers various types of SLMs, including liquid.

Article Content

Spatial Light Modulation Principles

Our SLMs support free-space optics, modulators for continuous wave (CW) sources, and advanced temporal light control. Integration with IR receivers, IR remotes, or LED lights makes them suitable ...

Universal photonic processor for spatial mode decomposition

To tailor the beam into arbitrary beam distributions, a spatial light modulator (SLM) is employed, using a complex amplitude modulation method [34] to create specific mode holograms.

Spatial Light Modulators | MEETOPTICS Academy

SLMs function by dynamically altering the properties of light through a matrix of pixels. These pixels are controlled electrically or optically to influence how light is transmitted or reflected.

Spatial Light Modulators

Spatial light modulator (SLM) is a general term describing devices that are used to modulate amplitude, phase, or polarization of light waves in space and time.

spatial light modulator

A spatial light modulator (SLM) is a pixellated liquid crystal device that can individually control the phase value of each pixel. It imposes spatially varying modulation onto an incident beam, allowing for the ...

CHAPTER 5: SPATIAL LIGHT MODULATOR SYSTEM

By using a combination of the FLC crystal, suitable polarizing optics and by switching the polarity of the applied voltage, it is possible to transmit or absorb an input light beam. The FLC device can be used ...

An Introduction to Spatial Light Modulators

One of the most commonly used modulation mechanisms today is the electrooptical spatial light modulator containing liquid crystals as the modulation material. The optical properties of the liquid ...

A 10 Megahertz Spatial Light Modulator

Here we introduce a new class of spatial light modulator that provides both 2D pixel geometry and high speed. The device operates by encoding spatial information in frequency bins via a broadband ...

Spatial light modulators

Key themes include the use of SLMs in optical imaging, holography, adaptive optics, and telecommunications, highlighting their role in enhancing image quality and enabling advanced ...

Spatial light modulator

A spatial light modulator (SLM) is a device that can control the intensity, phase, or polarization of light in a spatially varying manner. A simple example is an overhead projector transparency. Usually when ...
