

Terminal Box Splicing Method

Overview

Fusion splicing is most widely used as it provides for the lowest loss and least reflectance, as well as providing the most reliable joint. Virtually all singlemode splices are fusion. Fiber termination refers to the process of preparing the end of a fiber optic cable to connect to another fiber, a device, or a network. Either joining method must have three primary characteristics. Fiber optic strands are ultra-lightweight and about as thin as human hair, and yet, they have more than eight times the pulling tension of a copper wire. And because fiber optic cables carry light instead of electricity, they are not affected by changes in the temperature and can withstand extreme. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. When done poorly, it can lead to significant signal degradation, network downtime, and costly rework. This guide will walk you.
