

# What equipment is connected below the optical distribution box

## Overview

An optical Distribution Frame (ODF) or patch panel is the starting point for optical cables, most commonly found in rack cabinets in Head End (HE)/Central Office (CO)/Point of Presence (POP)/Data Centre (DC) or smaller cabinets or enclosures. It is used for deploying fiber to the edge. The ODF houses key components necessary to distribute critical data to devices, such as 5G small cell antennas, Wireless Access Points for traditional rack mount panels. For high-density applications, four 12-slot ODF shelves can be accommodated providing up to 48 slots. Opelink manufactures high-quality fiber optic distribution frames (ODF) designed for centralized fiber management in telecommunications facilities and data centers. Why do operators, designers, and installers use additional fiber optic hardware racks for cable and fiber management?

The active electronics are the most expensive part of the system. The Leviton HDF3168 Fiber Distribution System is an optical distribution frame that is designed for the high-density applications in the Main Distribution Area of Data Centers. It can also be deployed in any cross-connect architecture and still provide clear, managed pathways for fiber. Proper cable management not only ensures stability but also extends the lifespan of fiber links and improves.
